Tutorial Exercise

Stratified databases

Question 1 Consider the following database DB about policemen:

 $\begin{array}{l} \mathsf{takes_bribes}(x) \gets \mathsf{detective}(x), \mathsf{not}\; \mathsf{honest}(x) \\ \mathsf{honest}(x) \gets \mathsf{policeman}(x), \mathsf{not}\; \mathsf{rich}(x) \\ \mathsf{policeman}(x) \gets \mathsf{detective}(x) \\ \mathsf{policeman}(\mathsf{Eric}) \\ \mathsf{detective}(\mathsf{Frank}) \\ \mathsf{rich}(\mathsf{Frank}) \end{array}$

Eric and Frank are constants, and x is a variable.

(a) Construct a supported minimal model for DB using iterated fixpoints ('ABW').

(b) Check that your answer is (i) a model (ii) a minimal model and (iii) supported.

Question 2

(a) Consider the following database DB1:

```
\begin{array}{ll} \mathsf{strong}(x) \leftarrow \ \mathsf{big}(x), \mathsf{not} \ \mathsf{weak}(x) \\ \mathsf{strong}(x) \leftarrow \ \mathsf{small}(x), \mathsf{muscular}(x), \mathsf{not} \ \mathsf{weak}(x) \\ \mathsf{weak}(x) \leftarrow \ \mathsf{not} \ \mathsf{muscular}(x) \\ \mathsf{small}(\mathsf{Bill}) \\ \mathsf{muscular}(\mathsf{Bill}) \\ \mathsf{big}(\mathsf{Mary}) \end{array}
```

Bill and Mary are constants, and x is a variable.

i) Construct the iterated fixpoint model for database DB1.

ii) Check that your answer is a model for DB1 and that it is supported.

(b) Consider the following database DB2:

```
\begin{array}{lll} \mathsf{strong}(x) \leftarrow \ \mathsf{big}(x), \mathsf{not} \ \mathsf{weak}(x) \\ \mathsf{strong}(x) \leftarrow \ \mathsf{small}(x), \mathsf{muscular}(x), \mathsf{not} \ \mathsf{weak}(x) \\ \mathsf{weak}(x) \leftarrow \ \mathsf{small}(x), \mathsf{not} \ \mathsf{strong}(x) \\ \mathsf{small}(\mathsf{Bill}) \\ \mathsf{muscular}(\mathsf{Bill}) \\ \mathsf{big}(\mathsf{Mary}) \end{array}
```

Is Bill strong or weak according to the ABW semantics?

Question 3 Consider the following normal logic program *P*:

$$p \leftarrow r, \text{ not } q$$
$$q \leftarrow r, \text{ not } s$$
$$r$$

Compute the ABW ('iterated fixpoint') model of P.

Now suppose you do not stratify but simply compute $T'_{P}\uparrow^{\omega}(\emptyset)$. Check you get something different. (If there is a common mistake in exams, this is it. The silly candidate forgets to stratify.)
